

No, none of these specific ancient seeds grew into a tree used for building musical instruments.

All seven of the germinated 2,000-year-old Judean seeds (**Methuselah, Hannah, Judith, Boaz, Uriel, Jonah, and Adam**) belong exclusively to the **Judean date palm** (*Phoenix dactylifera*). [🌱 Permies.co... +1](#)

Palm trees are structurally unique and generally not used for making standard musical instruments for a few reasons:

Why Palm Trees Are Not Used for Instruments

- **Fiber Over Wood:** Palm trees are monocots, meaning they do not produce true, solid wood with ring growth. Instead, their trunks consist of a spongy, fibrous network of vascular bundles held together by a soft matrix. [🌐 Göteborgs universitet](#)
- **Lack of Resonance:** Stringed and wind instruments require dense, uniform tonewoods (like spruce, maple, or mahogany) that vibrate consistently to project sound. The porous, fibrous nature of palm "wood" muffles sound rather than amplifying it. [📺 YouTube · The Met +1](#)
- **Structural Weakness:** Palm wood lacks the structural integrity and rigidity needed to withstand the high tension of instrument strings or the precise carving required for wind instruments.

Minor Exceptions in Instrument Making

While palm *trunks* are useless for fine instruments like violins or guitars, minor parts of palm trees are sometimes used in folk music:

- **Seed Pod Percussion:** In various tropical cultures, large, naturally dried palm seed pods or fronds are occasionally hollowed out or used with their seeds inside to create simple shakers, rattles, or folk harps. [📺 YouTube · 10 Tampa Bay ... +1](#)
- **Ancient Regional Instruments:** The people of ancient Judea built their famous stringed instruments—like the *Kinnor* (lyre) and *Nevel* (harp)—using dense local woods like **cypress** or **almug/sandalwood**, rather than palm trees
